

Emergency Department Performance Optimization Model

Group 3

David Izrailov, Katherine Liu, Raul Mizan, Nika Nasseri, Haider Zaidi

The Problem

Assign

physicians to the
3 daily shifts

3-Day

influx of trauma
patients

Using

Statistical
Distributions
and Binary
Programming

Optimize

the ED performance
measured in speed
and/or quality

LOS

**72-HR
Return**

Our Approach

Objective Function

Minimize LOS

Minimize ROR

Decision Variable:

Binary

Who to staff?

When to staff?

1 Using Statistical Distributions

Approximate Demand

2 Data Analysis

Identify Constraints
and Patterns

**Historical Data Set of
daily patient visits to
ED**

Jan 2014 - Jul 2016

**Model
Development**

Objective Function

$$\min z = \sum_{i=1}^{28} \sum_{j=1}^3 \sum_{k=1}^3 (Q_i D_{i,j,k} + S_i D_{i,j,k}) \times E[X(j, k)]$$

D_{i,j,k}

Binary Decision Variable

Decision to Staff Physician i on Shift j of Day k

S_i

Variable (Speed),

Average LOS of Physician i

Q_i

Variable (Quality)

Average ROR of Physician i

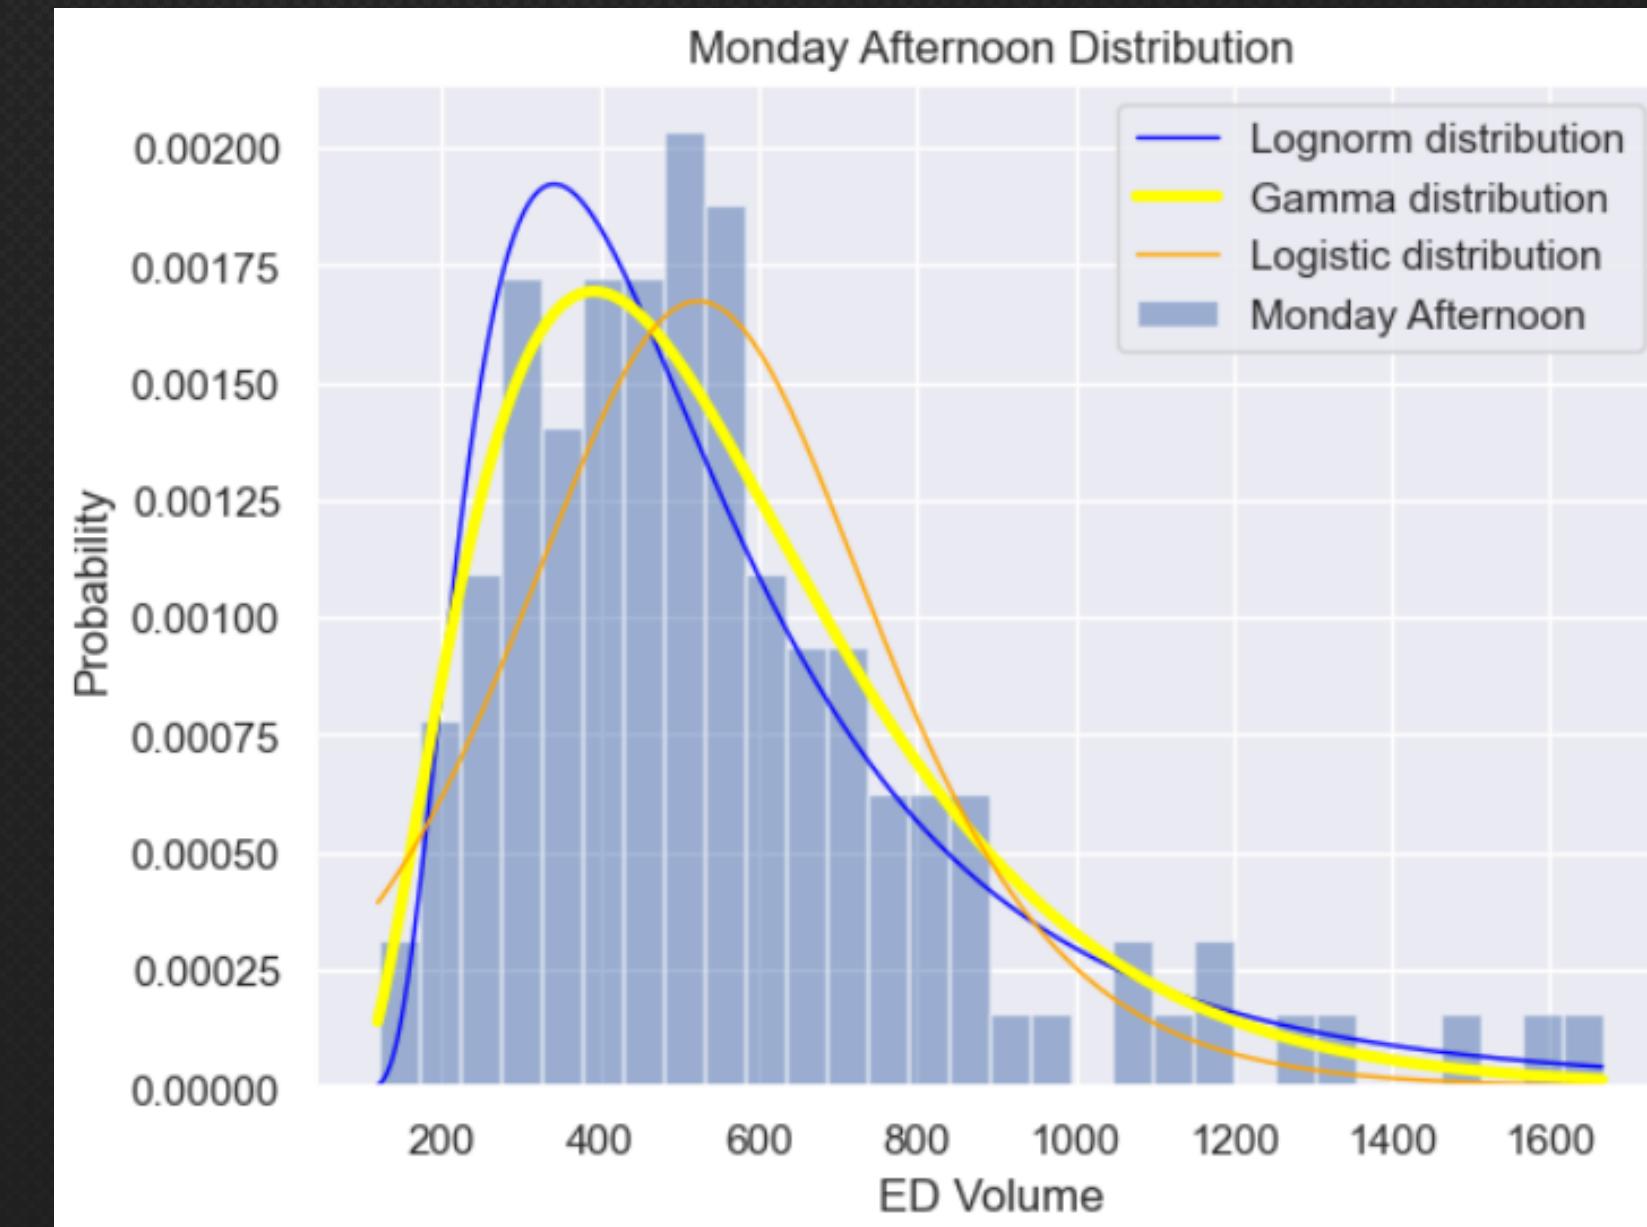

Objective Function

Demand Approximation

Sum of ED Volume of each shift per day

$$E[X(j, k)]$$

Fitting a statistical distribution to the histograms

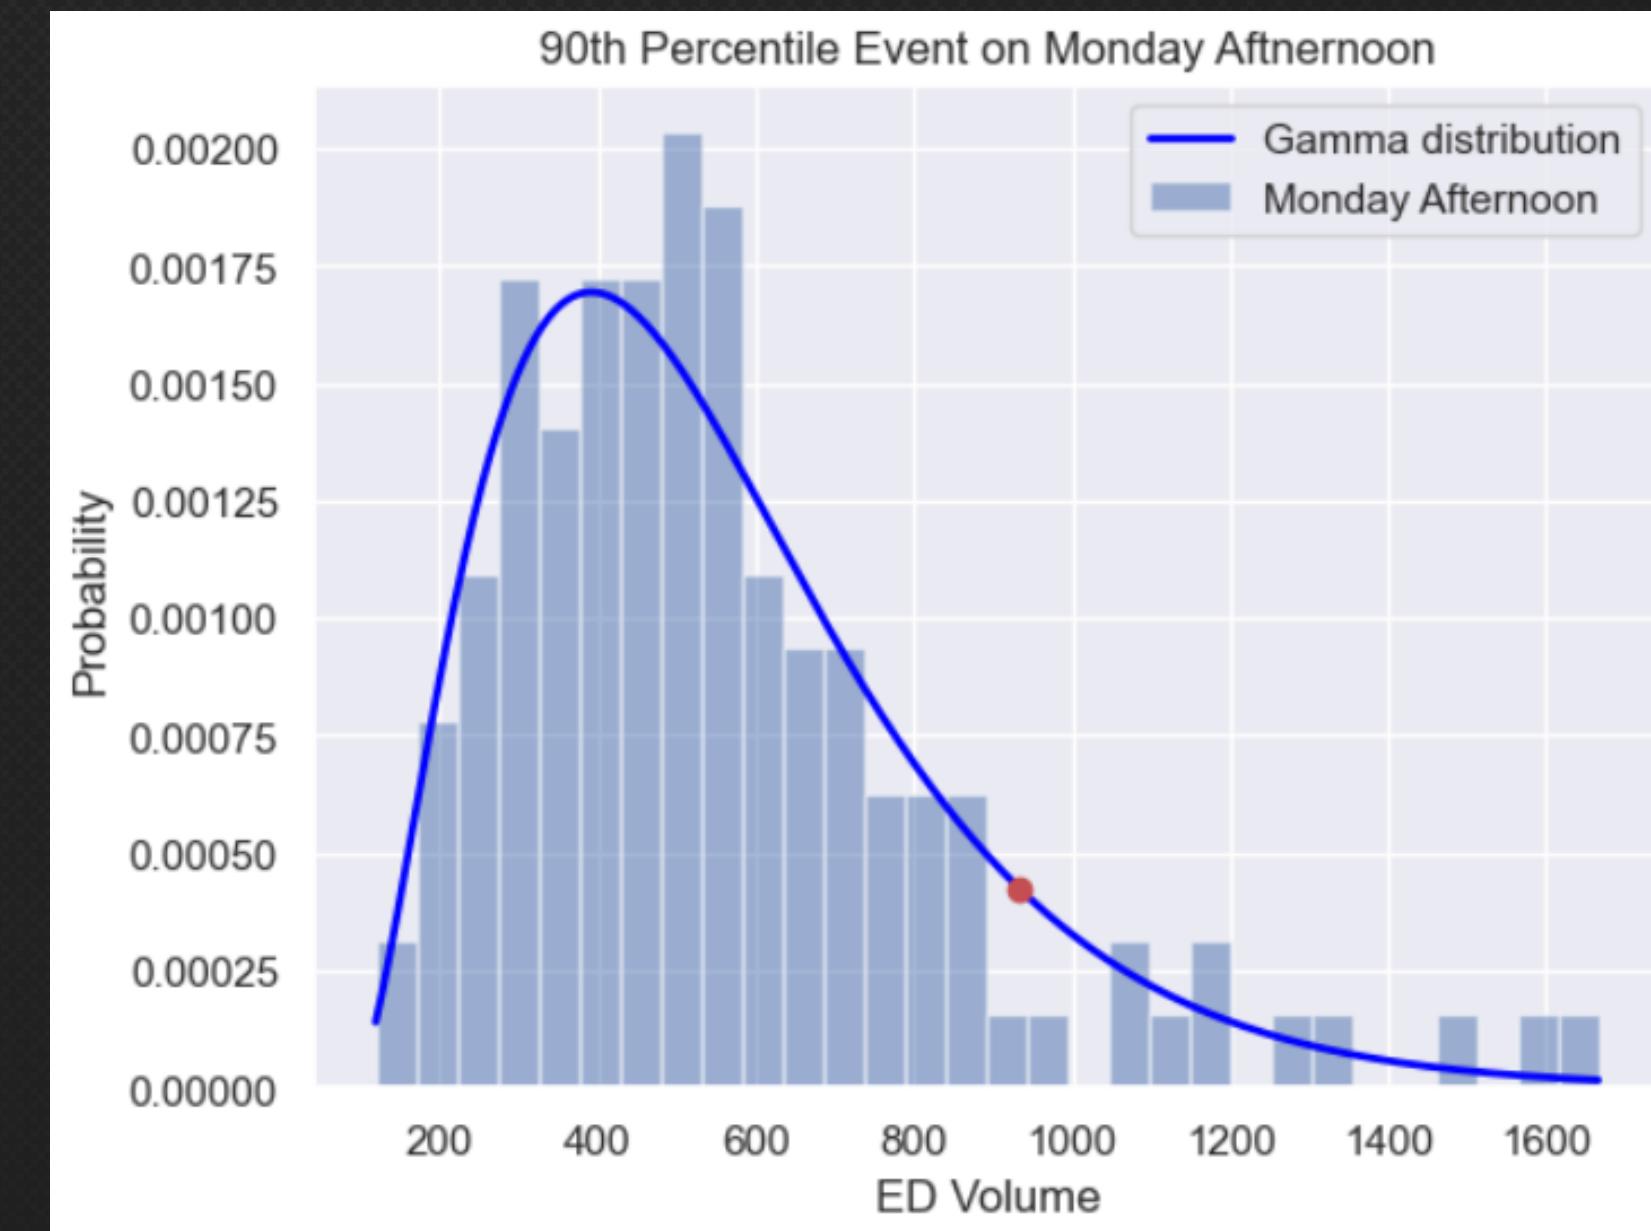

Objective Function

Tunable Parameters

Accounting for what percentile event is expected to happen

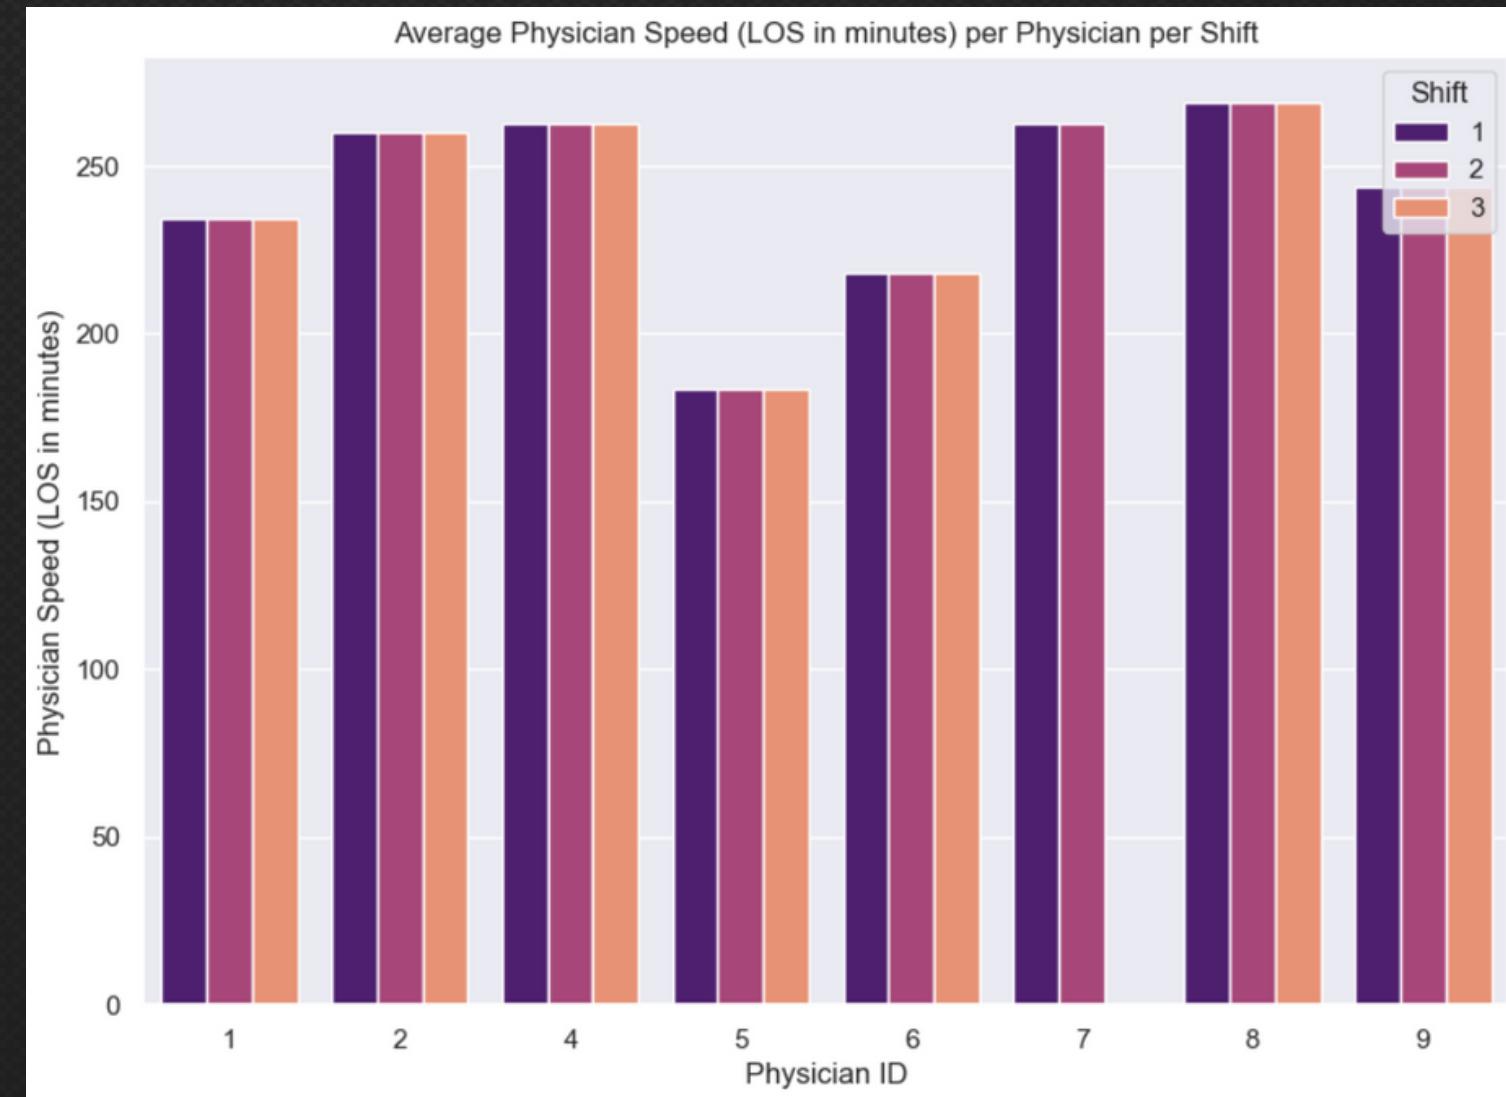

Our assumption: 90%

Objective Function

Physician Speed and Quality

Average of physician's LOS and ROR are consistent throughout different shifts and day

Constraints

1

Employment

Physicians who do not work at the ED

Physicians 3 and 20

Not in Dataset

Physicians 22 and 28

Past 6 months

$$x_{3,j,k} = 0, \forall j \forall k$$

$$x_{20,j,k} = 0, \forall j \forall k$$

$$x_{22,j,k} = 0, \forall j \forall k$$

$$x_{28,j,k} = 0, \forall j \forall k$$

2

Demand

Physicians staffed should meet Expected Demand with each physician's capacity as their Shift 1 average ED volume.

Assumed that if they could handle an amount in Shift 1, they could do the same on any shift

$$\sum_{i=1}^{28} (x_{ijk} * C_i) \geq E[X(j, k)] \forall j \forall k$$

Constraints

3

Physician-Specific

Consider day and shift preferences of physicians based on the past 2 years.

Some do not work
Mon or Tues

Some do not work
Shift 2 or Shift 3

$$\begin{aligned}x_{7,2,k} &= 0 \forall k, & x_{7,3,k} &= 0 \forall k, & x_{13,3,k} &= 0 \forall k, & x_{16,2,k} &= 0 \forall k, \\x_{16,3,k} &= 0 \forall k, & x_{18,2,k} &= 0 \forall k, & x_{18,3,k} &= 0 \forall k, & x_{19,2,k} &= 0 \forall k, \\x_{19,3,k} &= 0 \forall k, & x_{21,3,k} &= 0 \forall k\end{aligned}$$

4

Labour and Fairness

Ensures that physicians are not overworked, limiting them to 1 shift per day and no consecutive shifts.

$$\sum_j^3 (x_{i,j,k}) \leq 1, \forall i \forall k, \quad x_{i,3,k} + x_{i,1,k+1} \leq 1, \forall i, k = \{1, 2\}$$

Reserve physicians are limited to 1 shift in the period.

$$\sum_j^3 \sum_k^3 (x_{i,j,k}) \leq 1, i = \{7, 13, 14, 16, 18, 19\}$$

Physician 1 works Wednesdays.

$$\sum_j^3 (x_{1,j,3}) \geq 1$$

Results

- 16 Unique Physicians Staffed
- 8 Physicians Not Staffed (Under Performers)
- 4 Physicians Staffed the Maximum Amount (Best Performers)

Based on 90th percentile event and stated constraints. Management should use their discretion to adjust percentile and constraints.

| Physician/ Shift | Day 1 | | | Day 2 | | | Day 3 | | | Count |
|------------------|-------|---|---|-------|---|---|-------|---|---|-------|
| | 1 | 2 | 3 | 1 | 2 | 3 | 1 | 2 | 3 | |

Business Insights

1

Bridging the gap
between high and
low performers

4 Staffed Maximum
Amount vs 8 Not Staffed

2

The tradeoff
between speed and
quality

Physician 18 and 19 high
quality, more time.

3

Appropriate
utilization of
resources

Physician 17 more orders,
better speed and quality

Limitations and Implications

Limitations

1

Speed and quality weighted
equally

2

Doesn't factor in pre-existing
schedule

3

Inability to factor in social,
resource and financial
constraints

Implications

May not meet management ideals

Physicians might decline scheduling

May result in inefficient staffing,
spending, and wasted materials

Having Tunable Parameters

1

Allows the managerial team to make adjustments according to the situation they face and make the final decision

Lowering ROR and LOS

2

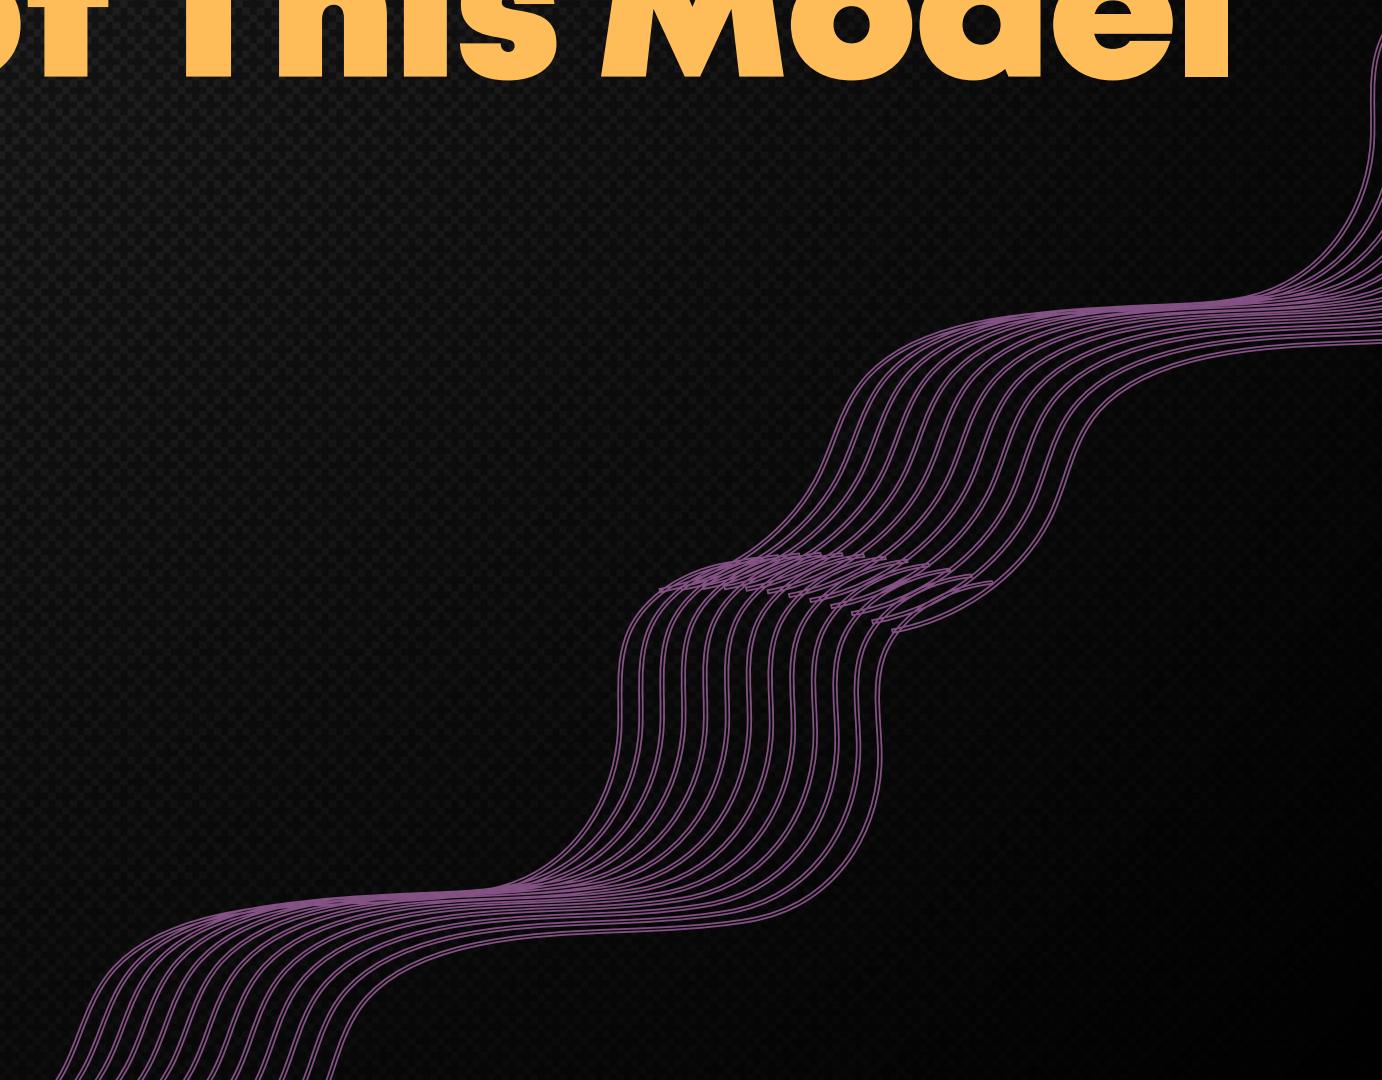

Does not sacrifice speed or quality for the other and takes both into consideration

Based on Detailed Dataset Analysis

3

Hidden information and patterns have been extracted from the data set and incorporated into the model

Advantages of This Model

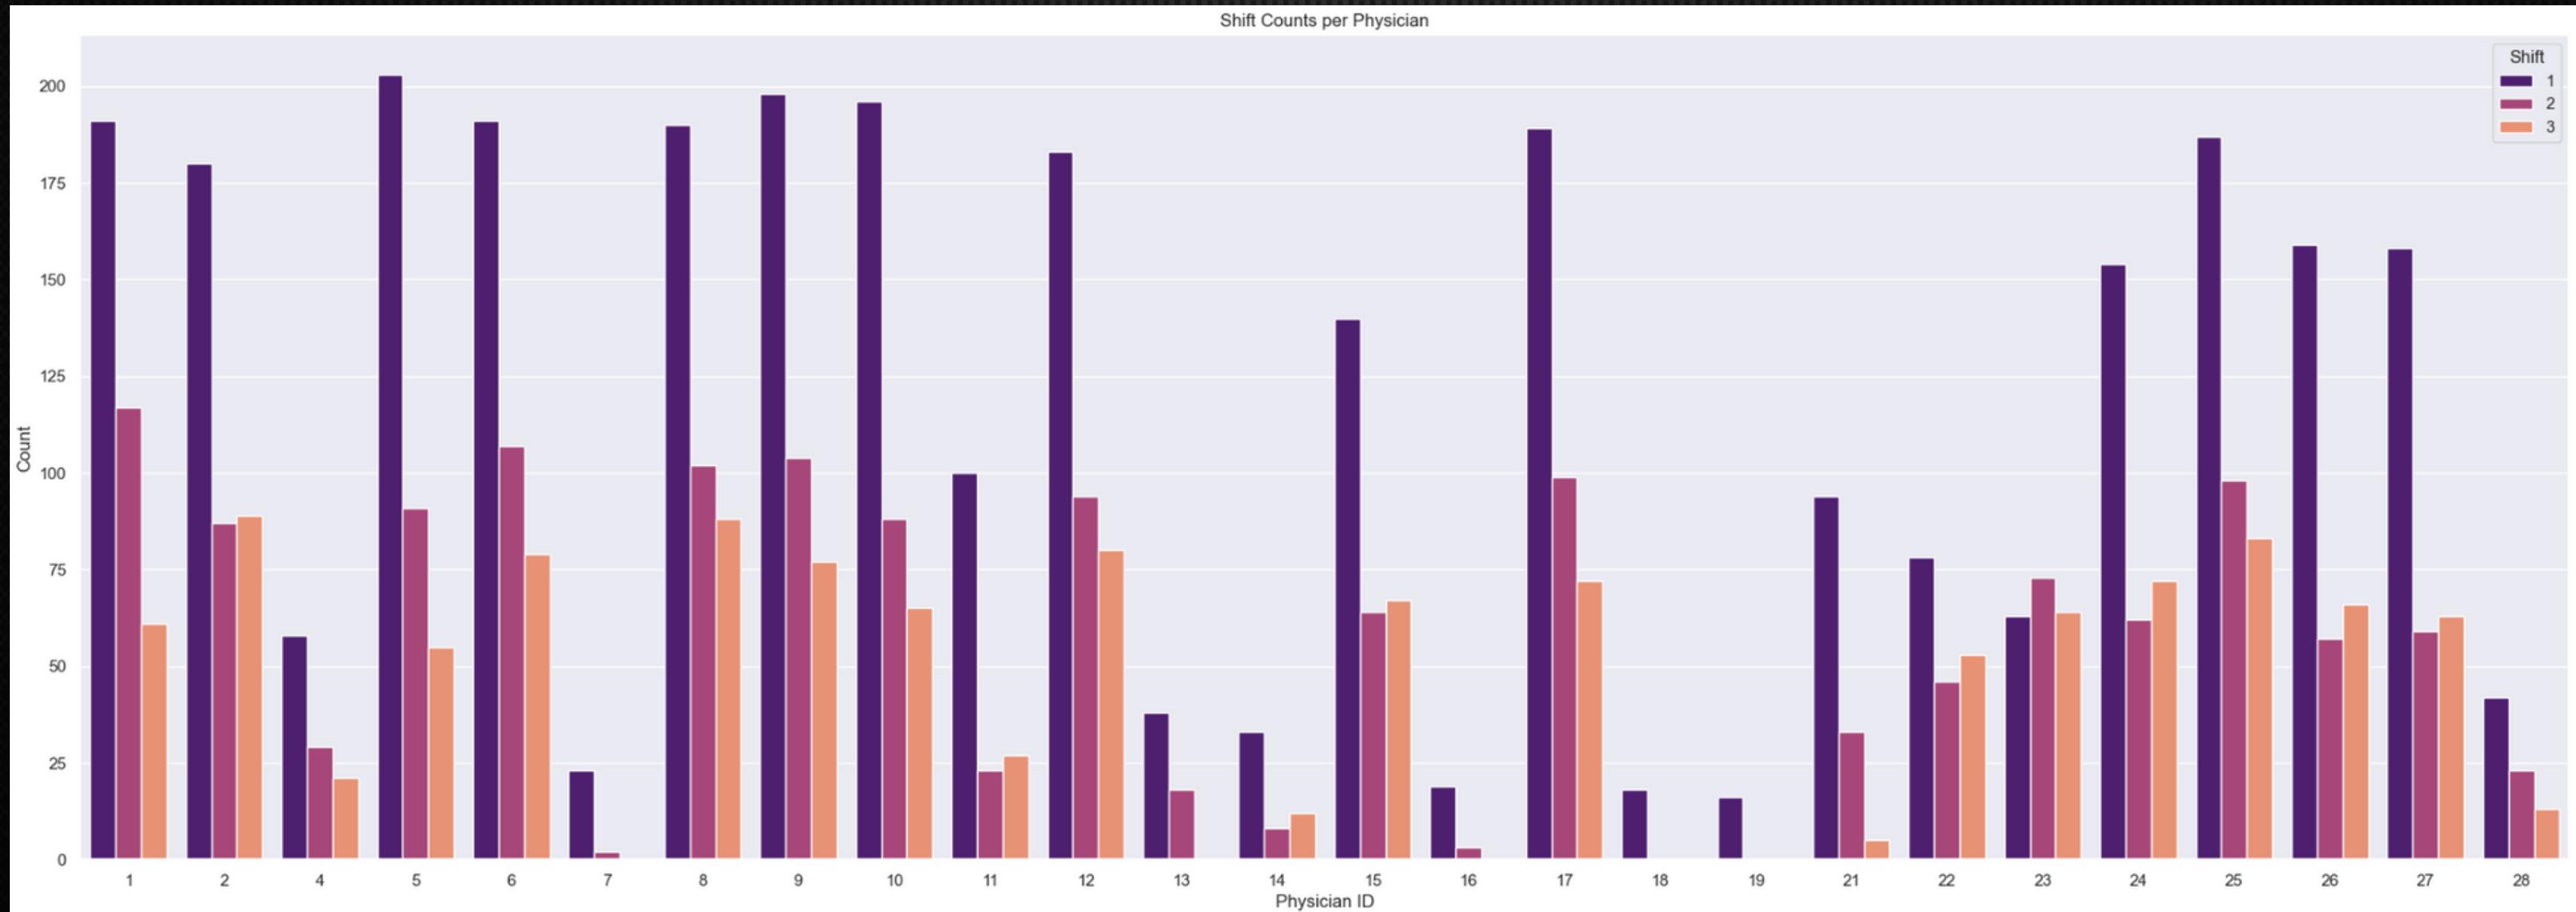

Thank You

Appendix

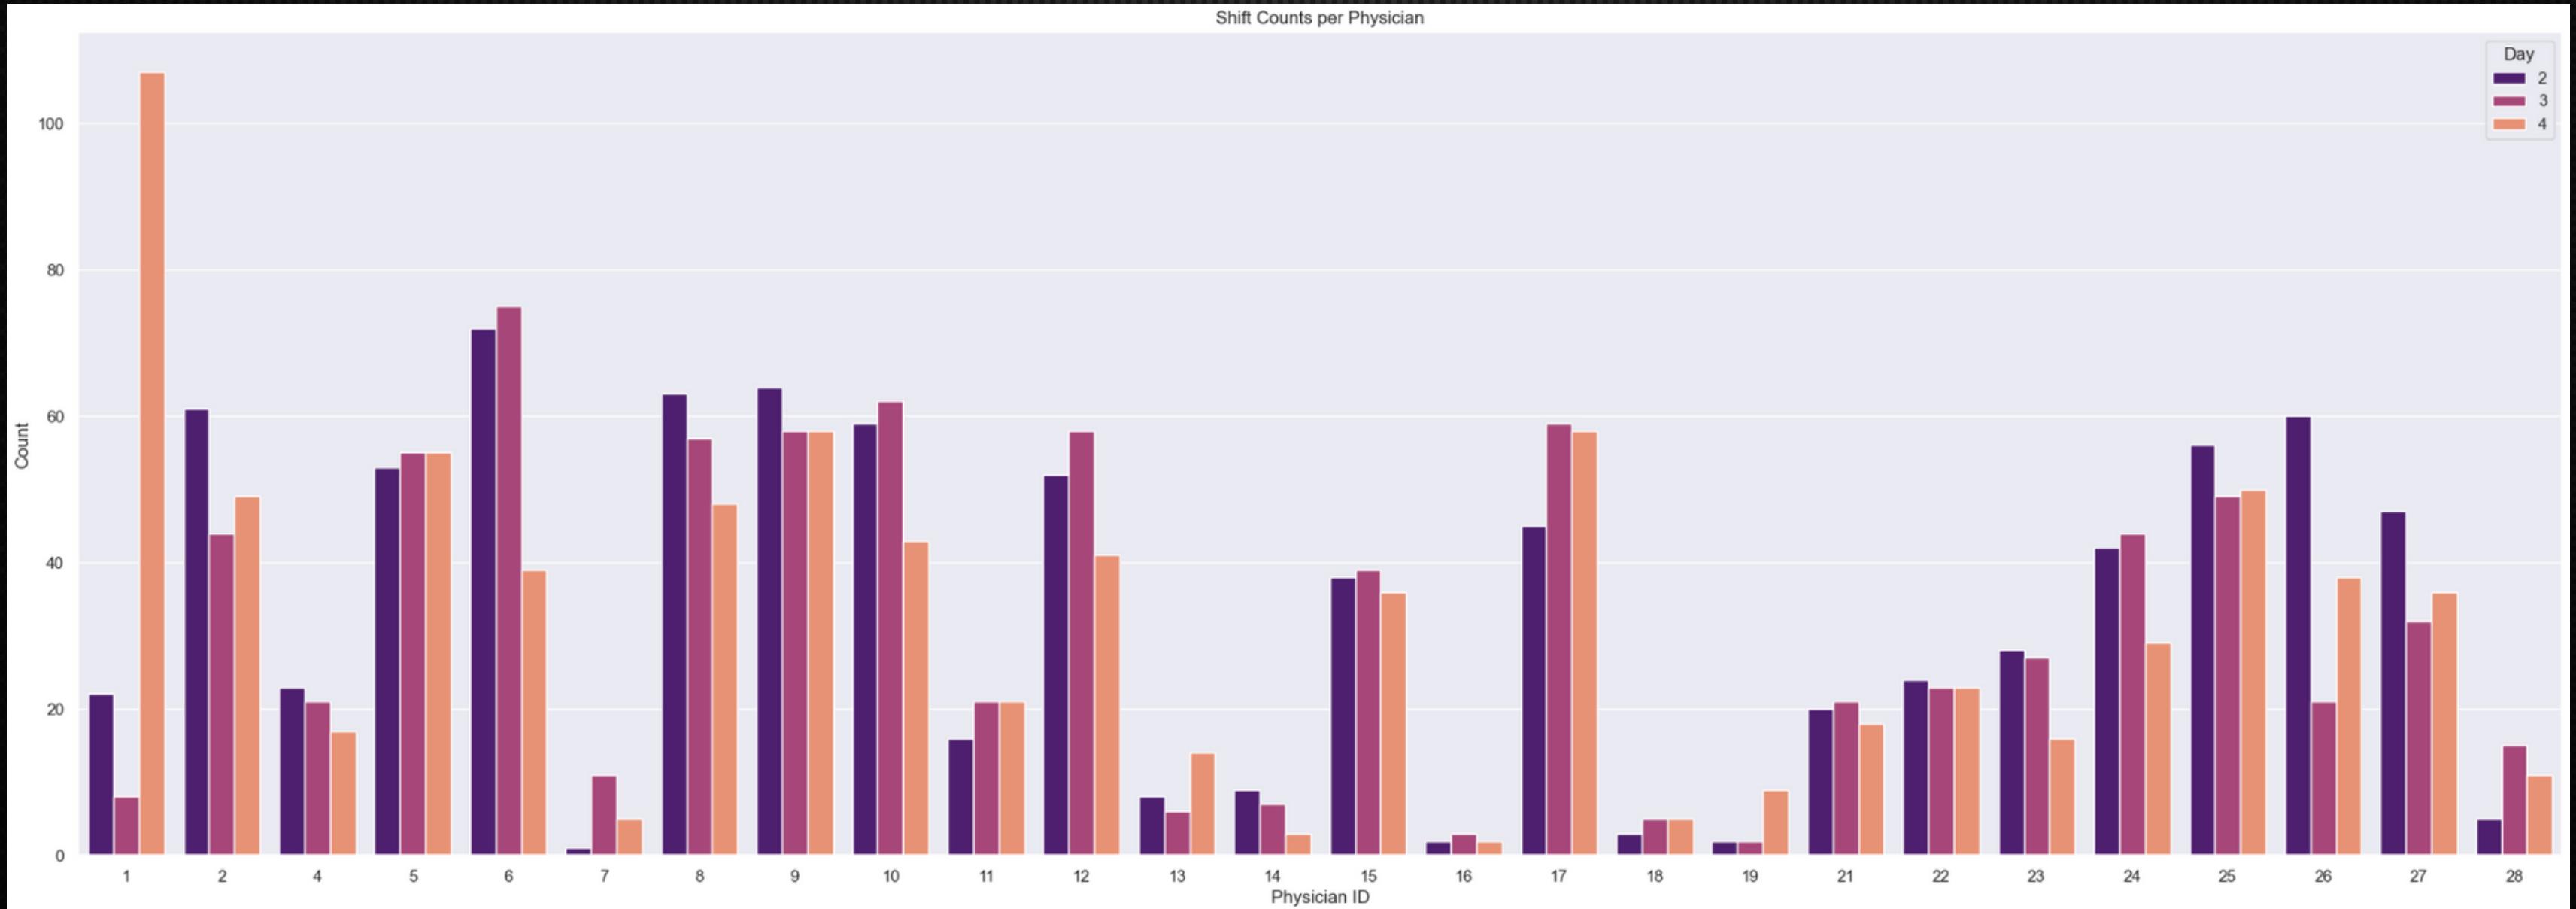

1. Shift counts for each physician
2. Day counts for each physician
3. Capacity
4. Average ESI per shift and physician
5. Distribution types
6. Sensitivity Analysis
7. Order Counts
